

Project AI Generated Text Detector

In this project, you will create a simple application that predicts whether a piece of text was written by a human or generated by AI.

You will train a Machine Learning or Deep Learning or Transformer based model, make it available through an API, and connect it to a small web interface where users can enter text and view the prediction.

Dataset

We will use the **AI vs Human Text** dataset from Kaggle:

<https://www.kaggle.com/datasets/shanegerami/ai-vs-human-text>

What You Will Do

1. Explore the dataset and understand its labels.
2. Prepare the text for model and Split the data into training and testing sets.
3. Convert the text into numerical features using TF-IDF or CountVec or Embeddings.
4. Train a text-classification model.
5. Evaluate the model using suitable classification metrics.
6. Save the complete trained pipeline.
7. Create an API that loads the model and returns predictions (using FastAPI).
8. Connect the API with the Frontend (ready UI , edit it if you like).
9. Run and test the complete application locally.

Expected Application

The user should be able to:

1. Enter or paste a piece of text.
2. Send it to the prediction API.
3. See whether the model predicts **Human-written** or **AI-generated**.
4. See the model's confidence score.

Final Deliverables

Submission link : <https://forms.gle/Dwt63iwXUF1wZcSs6>

GitHub repo or Drive link that include :

- the Model Training Notebook
- 2 Screenshot of the UI result , one with **Human-written** text and another with **AI-generated** text
- FastAPI `main.py`
